

CEXEC provides network perimeter protection by analyzing, designing, testing, deploying, and managing Firewall and related security services for Government, Military, and commercial customers.

First we assist our customers in developing, documenting, and analyzing their needs. If available, we begin this process by reviewing our customer's security policy which documents the use of laws, rules, and practices that regulates how an organization manages, protects, and distributes sensitive information. If an organization lacks a security policy related to network security perimeter protection, CEXEC will analyze their needs and work closely with the customer in developing a security policy.

We review security policies, network design, architecture and other related system security information to develop a firewall system and baseline configuration that is properly configured to provide maximum protection. We deny/block all ports, protocols and services that are not explicitly allowed. Based upon your network size, access points, and bandwidth needs, we will select the proper firewall configurations that adequately meet your current and future capacity and growth requirements. CEXEC employs WatchGuard Certified Systems Professionals that have successfully completed the required exams and manage firewalls and security services on a daily basis. We offer on-site installation services to assist getting your security system up and running quickly and efficiently.

We provide lower cost installation services for customers who know the security policies they want to enforce and have an accurate mapping of their network.

Call CEXEC to schedule an installation and obtain a cost estimate with a CEXEC certified WatchGuard Systems Professional (WCSP). Our WCSP engineer will assist you on an hourly basis by reviewing your network setup and helping you with the following:

- Firebox hardware setup
- Proxy rule configuration
- Logging
- Packet filter rule configuration
- WebBlocker configuration
- Route and related network accountability
- Trusted, optional, and external interface configuration (network & drop-in)
- Authentication setup
- MUVPN setup for one remote user
- Firebox security system software setup, registration, and configuration

Additionally, we offer on-site and off-site managed security services, in which we will monitor, maintain, operate, administer, and adjust your firewall to safeguard against new threats and vulnerabilities.
